This chart comes from an analysis of the 1999-2018 NHANES study that looked at populations of males and females between the ages of 8 and 85, with a total of 101,316 DXA scans. Our analysis displays ages 16-81+ and 33,049 participants who were considered eligible for the study. Body composition was measured using DXA technology, and averages and percentiles were calculated and constructed from the 33,049 participants.

<https://wwwn.cdc.gov/nchs/nhanes/search/datapage.aspx?Component=Examination>
Centers for Disease Control and Prevention. (n.d.). Examination data - continuous NHANES.

**The mean, also known as the average, in this case is the sum of all body fat percentages in the cohort divided by the total number of scans in the cohort, whereas the median is the middle value of all tested body fat percentages in the cohort.*

Evan Ruff	Male	Georgia Mobile	04/12/1981	75.0 in.	187.6	05/21/2026

Abdomen Composition

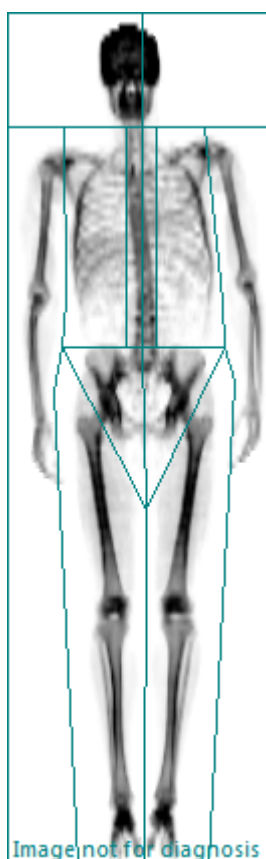

Adipose Tissue
1 Visceral
2 Subcutaneous

Subcutaneous fat is stored directly under the skin and is not as well associated with chronic disease. On the other hand, visceral fat is stored within the abdominal cavity with the digestive organs located in the android region. Visceral fat is associated with risk of developing conditions such as heart disease, stroke, diabetes, hypertension, gallstones and some types of cancer.

The android to gynoid (A/G) ratio is a secondary measurement used to assess potential risk of the above-mentioned health conditions in the event that a visceral fat measurement is unavailable. The ideal A/G ratio is less than 1.0 for optimal fat distribution.

Measured Date	Visceral Fat Pounds	Change	A/G Ratio
05/21/2026	3.08	1.08	1.29
07/23/2024	2.00	-	1.30

Head
Trunk
Android
Gynoid
Legs

Color Coding
Bone Lean Fat

Client	Sex	Facility	Birth Date	Height	Weight	Measured
Evan Ruff	Male	Georgia Mobile	04/12/1981	75.0 in.	187.6	05/21/2026

Trunk

Trunk includes the neck, chest, abdominal and pelvic areas. Its upper perimeter is the inferior edge of the chin and the lower perimeter intersects the middle of the femoral necks without touching the brim of the pelvis.

Measured Date	Total Mass	Change	Lean Tissue	Change	Fat Tissue	Change	Region Fat	Change
05/21/2026	93.1 lbs	-0.9 lbs	57.1 lbs	-4.8 lbs	33.8 lbs	3.8 lbs	37.2%	4.5%
07/23/2024	94.0 lbs	-	61.9 lbs	-	30.0 lbs	-	32.7%	-

Android

Android is the area between the ribs and the pelvis and is totally enclosed by the trunk region.

Measured Date	Total Mass	Change	Lean Tissue	Change	Fat Tissue	Change	Region Fat	Change
05/21/2026	14.6 lbs	0.4 lbs	8.6 lbs	-0.5 lbs	5.8 lbs	0.9 lbs	39.9%	5.3%
07/23/2024	14.2 lbs	-	9.1 lbs	-	4.9 lbs	-	34.6%	-

Gynoid

Gynoid includes the hips and upper thighs, and overlaps both the leg and trunk regions.
The total height of the gynoid region is two times the height of the android region.

Measured Date	Total Mass	Change	Lean Tissue	Change	Fat Tissue	Change	Region Fat	Change
05/21/2026	27.3 lbs	-1.7 lbs	18.3 lbs	-2.4 lbs	8.3 lbs	0.7 lbs	30.4%	4.2%
07/23/2024	29.0 lbs	-	20.7 lbs	-	7.6 lbs	-	26.2%	-

TOTAL BODY BONE DENSITY REPORT

Bone Mineral Density (BMD) is a measurement of minerals (mainly calcium and phosphorus) contained in a certain volume of bone. BMD is strongly linked to bone strength and resistance to fracture but people with low bone mass are not always at high risk of fracture. The BMD report predicts risk for osteopenia (mild bone loss, usually without symptoms) and osteoporosis (more severe bone loss) but it is NOT a diagnosis.

This is a full body bone density scan which can provide a general indication of relative bone density. This is not a replacement for a detailed bone density assessment ordered by your physician. If you have concerns with your numbers or want to assess your fracture risk, please contact your physician.

Total Body Bone Density

Bone Density: USA (Combined NHANES/Lunar)

The chart below provides a Total Body Bone Mineral Density (BMD) T-Score. The T-Score compares your bones to a healthy 30-year old adult of your sex.

T-Score: 1.0	
-1 and above	Normal
- 1.0 to -2.5	Potential Osteopenia
-2.5 and below	Potential Osteoporosis

Measure Date	BMD T-Score
05/21/2026	1.0
07/23/2024	1.3

The Z-Score listed in the below table compares your BMD to a person of your same age and of the same sex. The values are measured in standard deviations, and they show how your BMD compares to the given reference population.

Z Score: 0.6	% Population (Greater Than)
-1.5 to -0.5	7% - 30%
-0.5 to 0.0	30% - 50%
0.0 to 0.5	50% - 69%
0.5 to 1.5	69% - 93%
1.5 to 2.0	93% - 97%
2.0 and above	97% - 99%

Measure Date	BMD Z-Score
05/21/2026	0.6
07/23/2024	0.9

Client	Sex	Facility	Birth Date	Height	Weight	Measured

METABOLISM & NUTRITION INFORMATION

Resting Metabolic Rate (RMR) is an estimate of how many calories a person would burn if they were to do nothing but rest for 24 hours. This is an estimated number using the Mifflin St. Jeor equation. Generally speaking, most people are not sitting in bed all day, every day. To support weight or fat loss, it is generally recommended to consume 300-500 calories less than your Total Daily Energy Expenditure (TDEE). However, individual needs may vary.

Use the chart below to determine your *estimated* energy needs based off of your daily living and physical activity. For *most* people, the actual energy requirement falls within ± 200 kcal.

RMR	Estimated Energy Requirements	Total Daily Energy Expenditure (TDEE)	Daily Activity Category
1,583 cal/day For a more accurate RMR measurement schedule an appointment for a RMR Analysis Test with a staff member.	1,583 X 1.25		Sedentary - Only those physical activities required for typical daily living + little to no exercise
	1,583 X 1.375		Lightly Active - Daily living + 1-3 hours per week of easy exercise Example - walking 20-30 minutes per day a few times per week
	1,583 X 1.55		Moderately Active - Daily living + 3-5 hours per week of moderate exercise Example - brisk walking, cycling, or weight training 45-60 minutes
	1,583 X 1.725		Very Active - Daily living + 6-7 hours per week of vigorous exercise Example - running, HIIT, competitive sports

This graph is adapted from the *Institute of Medicine (2002)*, and *Dietary Reference Intakes for energy, Carbohydrate, Fiber, Fat, Fatty Acids, Cholesterol, Protein, and Amino Acids (Washington, D.C.: National Academies Press, 2005)*

We strongly advise consulting with your doctor or a registered dietitian before making any changes to your diet, or exercise routine, especially if you have any underlying health conditions or concerns. This recommendation is not intended to replace medical advice, diagnosis, or treatment.

FREQUENTLY ASKED QUESTIONS

Q: What is considered a healthy body fat %?

A: DEXA data shows healthy body fat is about 18–24% for men and 25–31% for women, according to groups like the American Council on Exercise and ACSM, but the best goal is one that fits your, gender, age, body type, and lifestyle.

Q: Which tissues make up the lean tissue category, and what percentage of that is actual muscle?

A: Lean tissue is comprised of mostly muscle, but also includes other tissues such as organs, fluids (blood and water), connective tissue like skin, cartilage, tendons & ligaments, and even the food you consume. For most people, around 70% of lean tissue is skeletal muscle.

Q: How do we calculate overall body fat %?

A: Total mass - bone mass divided by total fat Mass.

Q: How do I calculate my overall bone mass?

A: Total mass - (lean Tissue + total fat Mass).

Q: What's a realistic and effective rate of composition change?

A: With dedication and focus, we can see an average of 1 - 3 % composition change per month.

Q: What's the best way to see realistic changes in my composition?

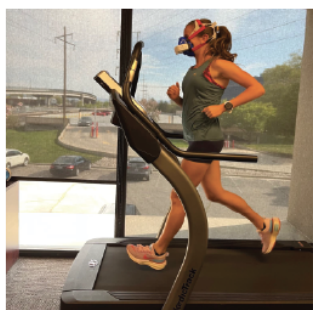

A: Nutrition + Exercise. Maintaining a healthy balanced diet with 60 mins/day of exercise, with 3–5 resistance training sessions per week and regular cardio .

Q: What is a healthy amount of visceral fat?

A: Research isn't specific, but the "less is more" principal applies here. The goal should simply be to carry as little visceral fat as possible. This can be achieved with a healthy, balanced diet, improved sleep, reduced stress, and minimizing smoking/alcohol consumption.

NEXT STEPS

Now that you've received your DEXA scan, what's next? We recommend scheduling a follow up DEXA Scan within 3 to 6 months, as well as our additional services below. Maintaining a healthy balanced diet with 60 mins/day of exercise, with 3-5 resistance training sessions per week and regular cardio should allow you to make progress and ultimately reach your goals.
